(25 apr. 2010) Gallery References Category:3D graphics softwareA new study investigating the effects of a common type of colon cancer treatment on men with advanced prostate cancer showed no clinically meaningful effects in any of the major health outcomes assessed. The study also showed that the chemotherapy does not provide any additional benefits to patients in improving their quality of life. But the research team led by Dr. Patricia McClincy of the Johns Hopkins Kimmel Cancer Center did find some evidence that the chemotherapy may delay the time to progression of the disease. The study was published online Sept. 15 in the Journal of Clinical Oncology. The chemotherapy, called FOLFOX6, consisted of the drugs fluorouracil (5-FU), which is derived from the fungus fluoromycin, and a combination of oxaliplatin and folinic acid (leucovorin). Other drugs commonly used in the chemotherapy of prostate cancer include the drugs irinotecan and docetaxel. "I was very surprised that we didn't find a major impact on survival in the patients who were treated," said lead author McClincy, an instructor in internal medicine. "Also, the improvement in quality of life was not statistically significant. But we did find a new and clinically meaningful result: FOLFOX6 delayed the time to progression of the disease." Patients with advanced prostate cancer who are treated with chemotherapy experience a 20 percent to 30 percent increase in their survival. The researchers enrolled 549 men with advanced prostate cancer into a clinical trial and randomly assigned them to receive one of the following treatments: 5
